Title: Aegis

Version: 4.25

Entered-date: 2MAR2024

Description: Aegis is a transaction-based software configuration management system. It provides a framework within which a team of developers may work on many changes to a program independently, and Aegis coordinates integrating these changes back into the master source of the program, with as little disruption as possible.

Aegis supports geographically distributed development. A very flexible mechanism is provided which may be used to keep two or more repositories synchronized.

Aegis runs on almost any flavor of UNIX. Self configuring using a script generated by GNU Autoconf. There are no modifications required to compile it for Linux.

Keywords: transaction based software configuration management, software configuration management, SCM, version control
